## So many fittings... Have You Found All the Leaks?

Dan Fallon, our previous CEO and president, once drove 120 miles to an account he knew had leaks because, while selling 50 kegs a month, they were burning out two compressors a year on their nitrogen generator. When Dan arrived, the gas supplier proudly explained how he had soaped down every possible leak source and could pronounce the gas supply leak-free! Twenty minutes later, they discovered two very large leaks. They were able to find the leaks because the In-Line Leak Indicator told them without question the system had leaks.

The McDantim In-Line Leak Indicator can tell you in seconds if you have leaks in your beer system and how big those leaks are no matter what gas source you use or how complicated your system is. A small leak of one-half cubic foot an hour wastes more gas each day than you would use to dispense two kegs of beer. One quick glance before you pour your first beer or after pouring your last beer assures you that you have no problem or that you need to call a service person. As you repair leaks, it serves as your scorecard, letting you know how much of the problem is resolved and if all leaks are fixed.

Our In-Line Leak Indicators are especially valuable in systems with Nitrogen generators. Leaks in these systems not only waste gas and electricity, but also kill off compressors. Rebuilding or replacing compressors is expensive and troublesome.
